SCIENCE Q TECH EMPLOYEE PERFORMANCE MAPPING

Problem scenario:

Science Q tech is a startup that works in the Data Science field. Science Q tech has worked on fraud detection, market basket, self-driving cars, supply chain, algorithmic early detection of lung cancer, customer sentiment, and the drug discovery field. With the annual appraisal cycle around the corner, the HR department has asked you (Junior Database Administrator) to generate reports on employee details, their performance, and on the project that the employees have undertaken, to analyze the employee database and extract specific data based on different requirements.

Objective:

To facilitate a better understanding, managers have provided ratings for each employee which will help the HR department to finalize the employee performance mapping. As a DBA, you should find the maximum salary of the employees and ensure that all jobs are meeting the organization's profile standard. You also need to calculate bonuses to find extra cost for expenses. This will raise the overall performance of the organization by ensuring that all required employees receive training.

1. Create a database named *employee*, then import **data_science_team.csv** **proj_table.csv** and **emp_record_table.csv** into the **employee** database from the given resources.

SQL Query:

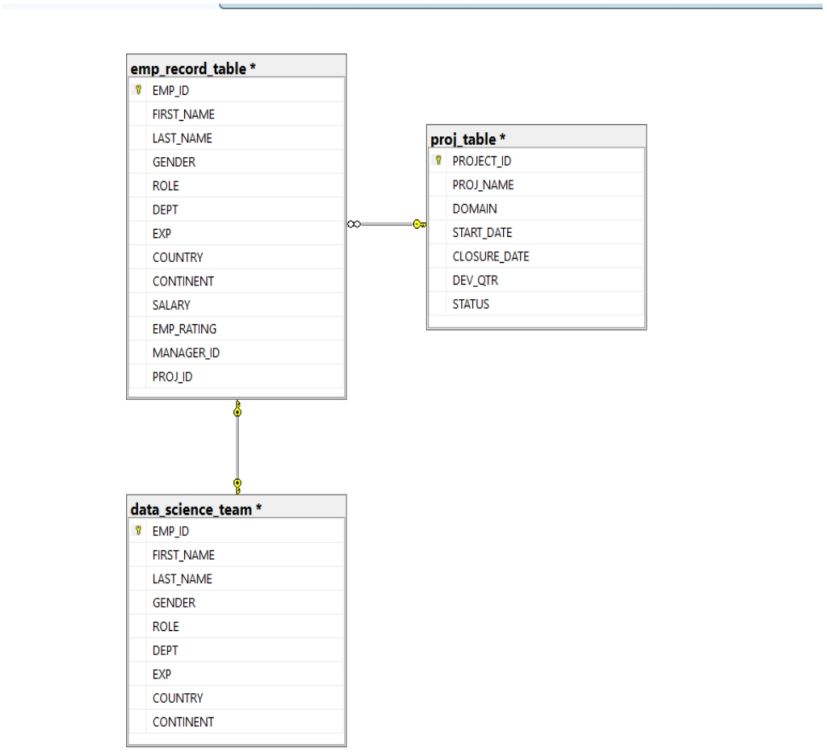

```
CREATE DATABASE employee;
USE employee;
```

Output:

Database employee created successfully and **data_science_team.csv, proj_table.csv** and **emp_record_table.csv** files imported successfully into the employee database.

2. Create an ER diagram for the given **employee** database.

Output:

3. Write a query to fetch EMP_ID, FIRST_NAME, LAST_NAME, GENDER, and DEPARTMENT from the employee record table, and make a list of employees and details of their department.

SQL Query:

```
SELECT
EMP_ID,
FIRST_NAME,
LAST_NAME,
GENDER,
DEPT
FROM emp_record_table;
```

Output:

4. Write a query to fetch EMP_ID, FIRST_NAME, LAST_NAME, GENDER, DEPARTMENT, and EMP_RATING if the EMP_RATING is:
    - less than two
    - greater than four
    - between two and four

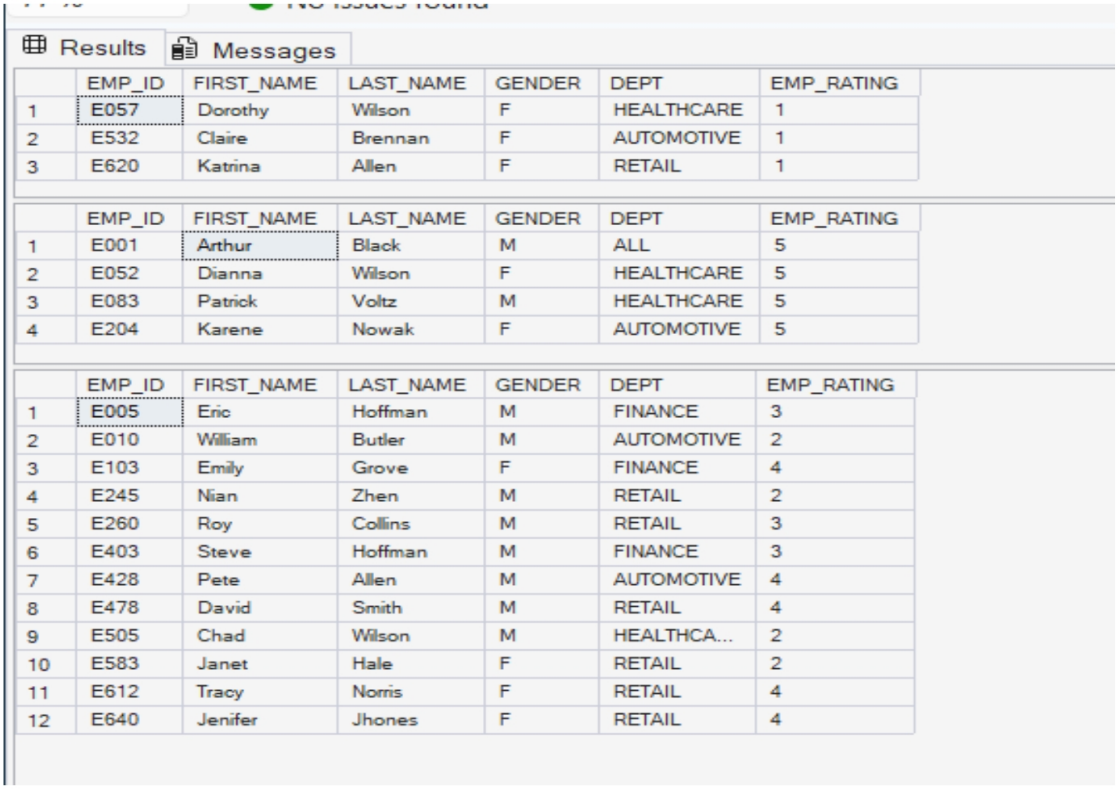

SQL Query:

```
-- Less than 2
SELECT EMP_ID, FIRST_NAME, LAST_NAME, GENDER, DEPT, EMP_RATING
FROM emp_record_table
WHERE EMP_RATING < 2;

-- Greater than 4
SELECT EMP_ID, FIRST_NAME, LAST_NAME, GENDER, DEPT, EMP_RATING
FROM emp_record_table
WHERE EMP_RATING > 4;

-- BETWEEN 2 AND 4
SELECT EMP_ID, FIRST_NAME, LAST_NAME, GENDER, DEPT, EMP_RATING
FROM emp_record_table
WHERE EMP_RATING BETWEEN 2 AND 4;

CONCLUSION

In this project, I analyzed the employee database of Science Q tech to support performance evaluation and reporting for the HR department. By using SQL queries, I was able to retrieve and organize important information related to employee details, their assigned projects, and performance metrics.

This project helped in understanding how a database can be effectively used to track employee performance and support decision-making during appraisal cycles. It also improved my skills in writing SQL queries, managing relational data, and generating meaningful reports from structured datasets.

Overall, this project demonstrates how database systems play a crucial role in real-world business scenarios such as employee performance analysis, resource management, and data-driven decision-making.
